

# Sucher

BlackBerry's device search — rebuilt, for any Android phone

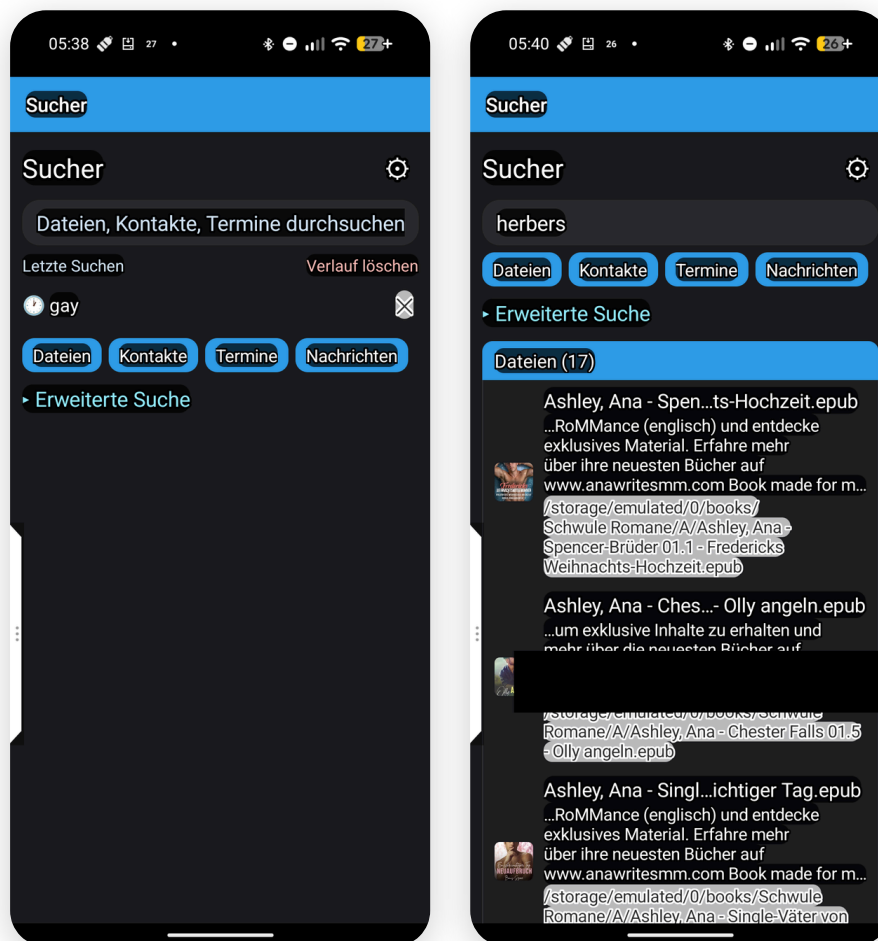

Missing BlackBerry's device-wide search: Sucher searches file names AND contents (Office, PDF, e-books, comic metadata), plus contacts, calendar entries and captured notifications — all through a single search box. BlackBerry Hub itself can only search notifications that actually came through; Sucher can do more overall: real full-text search inside Office documents, PDFs and e-books, something BlackBerry's own search never could.

### Advanced search

Filter specifically by author, title, book series, file type, or creation/modification date, instead of only by file name.

### Full text in real documents

TXT/MD, DOCX/XLSX/PPTX, classic DOC/XLS/PPT, PDF, EPUB/FB2 and MOBI/AZW3 — content, not just the file name. Comic archives (CBZ) at least deliver series, title and summary from `ComicInfo.xml`.

### Contacts, calendar, notifications

All in the same search as files — capturing notifications is optional and protected by its own permission screen.

### Open source, verifiable

Full source code, build instructions and changelog right in the app and on GitHub. GNU GPLv3; bundled third-party libraries stay under their own, compatible license (Apache 2.0 / BSD-3-Clause).

## System requirements

|                            |                                                                                                                                                             |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Android</b>             | 10.0 (API 29) or newer.                                                                                                                                     |
| <b>Manage all files</b>    | for file search across all of storage, not just the media types Android otherwise exposes — granted via its own system screen, not a normal runtime dialog. |
| <b>Read contacts</b>       | optional, only if contacts should be searched too.                                                                                                          |
| <b>Read calendar</b>       | optional, only if calendar entries should be searched too.                                                                                                  |
| <b>Notification access</b> | optional, only to make captured notifications (chats, mail, messengers) searchable.                                                                         |

## Try it yourself

Source code, build instructions and a ready-made APK are available on GitHub:

[github.com/8818freak/Sucher](https://github.com/8818freak/Sucher). No Gradle, no hidden dependencies, no account needed. Feedback and ideas are welcome.
